

FRANK DITZ

Melbourne, FL | ditzfrank@gmail.com | linkedin.com/in/frank-ditz

SUMMARY

Customer-facing field software engineer owning technical delivery from discovery and solution design through integration and production troubleshooting. Promoted from intern to associate while delivering solutions across APIs, cloud, data, security, and AI for 3 enterprise customers.

EXPERIENCE

ALTR

Associate Field Software Engineer - Data Governance & Security

Melbourne, FL

Sep 2025 - Feb 2026

Field Engineering Intern

Aug 2024 - Aug 2025

- Served as customer-facing technical owner on implementations across Snowflake, PostgreSQL, and AWS.
- Led technical discovery and requirements scoping, translating security, compliance, and operational constraints into practical solution designs.
- Built and hardened Python, Node.js, and SQL integrations connecting REST APIs, cloud services, databases, and external systems with authentication, validation, and explicit failure handling.
- Rapidly prototyped secure access patterns using RBAC, masking, tokenization, and encryption so customers could evaluate tradeoffs without weakening governance controls.
- Resolved blockers across APIs, authentication, databases, and cloud services using targeted test environments, structured logging, and direct collaboration with customers and internal engineers.

Ditz Medical & Laser Aesthetics Center

Melbourne, FL

Manager

Jan 2020 - Jul 2024

- Managed daily operations across scheduling, billing, inventory, staff coordination, and client communication.

TECHNICAL SKILLS

Languages: Python, SQL, JavaScript, TypeScript

Field Engineering & Delivery: Technical discovery, requirements scoping, solution design, rapid prototyping, customer implementation, production deployment, handoff, enterprise integration, stakeholder communication

Backend & Applied AI: FastAPI, Node.js, REST APIs, Pydantic, OpenAI API, tool calling, agent workflows, structured outputs

Cloud, Data & Security: AWS Lambda, Step Functions, S3, Docker, Terraform, Snowflake, PostgreSQL, Alation, Fivetran, RBAC, tokenization, encryption

Quality & Reliability: pytest, MyPy, Ruff, GitLab CI/CD, logging, retries, pagination, idempotency

SELECTED FIELD ENGINEERING PROJECTS

AI-Powered Enterprise Data Assistant

- Built a Python/Streamlit application using OpenAI tool calling across Snowflake, PostgreSQL, and Alation, enabling non-technical users to turn natural-language requests into governed answers, tables, and charts.
- Designed metadata-first tools for catalog lookup, schema inspection, query execution, and response formatting with Snowflake RSA key-pair authentication, RBAC, and query safeguards; resolved session and connector reliability issues.

Fivetran / Snowflake Encryption Workflow

- Mapped a customer's ingestion lifecycle, identified an earlier raw PII exposure point, and shifted protection closer to ingestion to reduce the exposure window.
- Built a metadata-driven Snowflake workflow using Fivetran sync timestamps, deterministic encryption, idempotent processing, and encryption-state tracking so retries remained safe and protection was repeatable.

Pre-Ingestion PII Tokenization Pipeline

- Built a serverless AWS-to-Snowflake integration with checkpointing, retries, persistent state, record validation, and audit logging to process tens of thousands of rows reliably within Lambda limits.

Python SDK for ALTR APIs

- Built a typed Python SDK for 100+ REST API endpoints with Pydantic models, pagination, retries, structured exceptions, logging, and GitLab CI.
- Structured the SDK around a shared session layer and modular resource mixins for handoff, making integrations easier for other engineers to extend and troubleshoot.

EDUCATION

University of Central Florida - Data Analytics Bootcamp | Certificate

Aug 2023

University of Florida - Bachelor of Arts in Biology | Academic Scholarship

Dec 2018
